PERICOM[®]

PI74AVC+16836

2.5V 20-Bit Universal Bus

Driver with 3-State Outputs

Features

- PI74AVC+16836 is designed for low-voltage operation, $V_{CC} = 1.65V$ to 3.6V
- True ±24mA Balanced Drive @ 3.3V
- I_{OFF} supports partial power-down operation
- 3.6V I/O Tolerant inputs and outputs
- Meets PC133 SDRAM Registered DIMM Specifications
- All outputs contain a patented DDC (Dynamic Drive Control) circuit that reduces noise without degrading propagation delay
- Industrial operation: -40° C to $+85^{\circ}$ C
- Packaging (Pb-free & Green available):
 56-pin 240-mil wide plastic TSSOP (A)

Description

Pericom Semiconductor's 20-bit PI74AVC+16836 universal bus driver is designed for 1.65V to 3.6V V_{CC} operation.

Data flow from A to Y is controlled by the Output Enable (\overline{OE}) input. The device operates in the transparent mode when the latch-enable (\overline{LE}) input is LOW. When \overline{LE} is HIGH, the A data is latched if the clock (CLK) input is held at a high or low logic level. If \overline{LE} is HIGH, the A data is stored in the latch/flip-flop on the low-to-high transition of CLK. When \overline{OE} is HIGH, the outputs are in the high-impedance state, but all the inputs are enabled and data is capable of being stored in the register.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Truth Table⁽¹⁾

	Inputs								
ŌĒ	LE	CLK	Α	Y					
Н	Х	Х	Х	Z					
L	L	Х	L	L					
L	L	Х	Н	Н					
L	Н	Ŷ	L	L					
L	Н	Ŷ	Н	Н					
L	Н	L or H	Х	Yo ⁽²⁾					

- 1 H = High Signal Level
 - L = Low Signal Level
 - Z = High Impedance
 - \uparrow = Transition LOW-to-HIGH
 - X = Irrelevant
- 2. Output level before the indicated steady-state input conditions were established.

PI74AVC+16836 2.5V 20-Bit Universal Bus Driver with 3-State Outputs

Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Supply voltage range, V _{CC} 0.5V to +4.6V
Input voltage range, V _I 0.5V to +4.6V
Voltage range applied to any output in the
high-impedance or power-off state, $V_0^{(1)}$ 0.5V to +4.6V
Voltage range applied to any output in the
high or low state, $V_0^{(1,2)}$
Input clamp current, $I_{IK}(V_I < 0)$
Output clamp current, $I_{OK}(V_O < 0)$
Continuous output current, I _O ±50mA
Continuous current through each V _{CC} or GND ± 100 mA
Package thermal impedance, $\theta_{JA}^{(3)}$:
Storage Temperature range, T _{stg} 65°C to 150°C

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

- 1. Input & output negative-voltage ratings may be exceeded if the input and output curent rating are observed.
- 2. Output positive-voltage rating may be exceeded up to 4.6V maximum if the output current rating is observed.
- 3. The package thermal impedance is calculated in accordance with JESD 51.

Recommended Operating Conditions⁽¹⁾

		Min.	Max.	Units
