

PI74LVCC4245A

8-Bit Dual Supply Bus Transceiver with Configurable Output Voltage and 3-State Outputs

Product Features

- 4.5V to 5.5V on A-port and 2.7V to 5.5V on B-port
- Latch-up performance exceeds 200mA Per JESD78
- ESD protection exceeds JESD 22
 - 2000V Human-Body Model (A114-B)
 - 200V Machine Model (A115-A)
- Industrial Temperature: –40°C to +85°C
- Available Packages:
 - 24-pin 173-mil wide plastic TSSOP (L)
 - 24-pin 150-mil wide plastic QSOP (Q)
 - 24-pin 300-mil wide plastic SOIC (S)

Product Description

Pericom Semiconductor's PI74LVC series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speed.

The PI74LVCC4245A is a non-inverting 8-bit Bidirectional Transceiver that uses two separate power supply rails. A-port (V_{CCA}) is set to operate at 5V and B-port (V_{CCB}) is set to operate from 3.3V to 5V. This allows for translation from a 3.3V to a 5Venvironment and vice-versa. This tranceiver is designed for asynchronous two-way communication between data buses. The direction control input pin (DIR) determines the dataflow from the A bus to the B bus or from the B bus to the A bus. The output enable (\overline{OE}) input, when HIGH, disables both A and B ports by placing them in HIGH Z condition.

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

- 2. This value is limited to 7V maximum.
- 3. The package thermal impedance is calculated in accordance with JESD 51.

^{7.} C_{PD} is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I_{CCD}) at no output loading and operating at 50% duty cycle, C_{PD} is related to I_{CCD} dynamic operating current by the expression: $I_{CCD} = (C_{PD})(V_{CC})(f_{IN}) + (I_{CC} \text{ static})$

Power- Up Considerations

To avoid excessive supply current, bus contention or oscillation during power-up, the following guidelines should be followed:

- 1. Connect ground first before any supply voltage is applied.
- 2. Then Power up V_{CCA}, which is the control side of the device.
- 3. Ramp \overline{OE} ahead of or with V_{CCA} to help prevent bus contention
- 4. Ramp DIR with V_{CCA} if DIR high is needed (A bus to B bus). Otherwise keep DIR Low.
