

## Interface Units

### Weidmüller Interface Units

From the point of view of saving costs when producing switchgear cabinets, interface units offer an alternative concept to the wiring of single conductors. The main task of interface units is the trouble-free conversion of standardised plug-in connector systems to single conductor wiring or to another connection system.

Interface units are composed of the following components:

- extrusion profile for insertion of the card
- end plate for mounting rail installation
- mounting feet for installing onto standardised TS 32 and TS 35 mounting rails
- printed-circuit board with connection and indicating elements, preassembled DIN plug-in connectors and tag carriers for marking electrical equipment

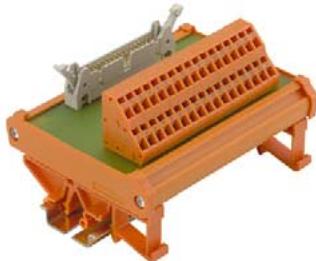

The plug-in connectors used in the interface units are divided into the following groups:

- ribbon cable plug-in connectors according to IEC 603-1/DIN 41 651.
- subminiature connectors (SUB-D) according to IEC 807-2/DIN 41 652.
- connectors for printed circuits according to IEC 603/DIN 41 612 and 41 617.
- ELCO connectors for EXi applications in the processing industry

Pre-assembled cables with corresponding plug-in connector systems are used for connections between higher-level controls and interface units.

This is where the user has the largest potential for saving costs. The use of system cables with large numbers of poles considerably reduces wiring costs, consisting of wage and material costs. The conversion to single conductor wiring is made directly at the interface unit. The user is offered screw / tension clamp or plug-in connections to connect actuators and sensors. Optional additional functions such as status indicators, signal separation, fuses or shielding can be integrated. Marking systems ease the task of assigning signals to the respective elements.

#### Interface unit RSF for ribbon cables in accordance with IEC 603-1/DIN 41 651

Passive interface for 10...64 signals to adapt pre-assembled ribbon cable plug-in connectors to a screw or tension clamp connection in accordance with IEC 603-1/ DIN 41 651.

Combined with an LED status indicator, the modules provide rapid information on the switching status of incoming and outgoing signals within a control unit.

#### Interface unit RSSD for subminiature plug-in connectors (SUB-D) in accordance with IEC 807-2/DIN 41 652

Passive interface for 9 ... 50 signals for conversion of preassembled cables with SUB-D connectors in accordance with IEC 807-2/DIN 41 652 to screw or tension clamp connection technology. The modules are delivered with either socket strips (female) or pin headers (male). A spacer block between the plug-in connectors and the card takes up the mechanical forces created by the connected cable. RSSD interface units are optionally available with a frame terminal for connecting shielded conductors. An additional potential connection eases testing and measuring during commissioning and maintenance tasks.

Advantages of interface units:

- space-saving mounting by using two and three tier card connection elements.
- cost saving, unilateral conventional single conductor wiring.
- more protection against faulty wiring.
- additional options: Status indication by integrating LEDs on the interface unit.
- faster troubleshooting thanks to additional test and measurement devices.
- simplified commissioning and documentation.

Using interface units allows trend-setting rationalisation concepts to be carried out in switchgear cabinet manufacturing. Not only do they reduce the share of pure labour costs of wiring tasks, but also the share of costs for materials, such as cable and conductors, cable ducts, terminal blocks and terminal boxes.

Customer-specific wiring concepts are efficiently put into practice by the use of special interface units.

#### RS VERT interface units as potential distributors

Passive interface for distributing DC supply voltages. The interface units are available in three versions for distribution to 8, 16 and 72 connection elements for the positive and negative potentials.

- 8- 16-channel distributors in 45-mm, 72-channel distributors in 100-mm widths.
  - power supply via two connection elements respectively for positive and negative potentials.
  - Mount on to TS 32/35 mounting rails.
- RS VERT potential distributors can be installed in small distributor boxes, and provide a clearly arranged potential distribution.

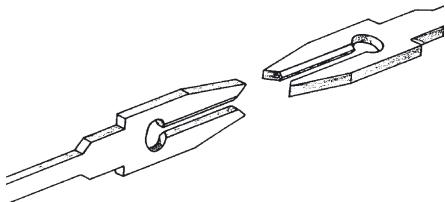

## Interface Units

### Interface units RSELCO for hermaphroditic plugs

Passive interface to convert hermaphroditic ELCO multipole connectors to input and output with screw connections.

Hermaphroditic contacts are achieved by a fork that is identical at both ends of the connection.

The advantage of this type of connector is essentially the large contact area (making it suitable for low currents), the long operational lifetime, and the high resistance to shock and vibration.

An adjustment screw eases insertion, and ensures a reliable interlock of the pair of connectors.

All types are available as "left" and "right" versions.

All interface units are supplied individually marked with consecutive numbering, and can be fitted with 6-digit group markers. The universal foot allows all modules to be assembled onto TS 32, TS 35x7.5 and TS 35x15 mounting rails in accordance with the European standards EN 50 035 and EN 50 022.

### Interface unit RSDIN for plug-in connectors according to IEC 603 / DIN 41 612 and 41 617

Passive interface for adapting the female and male connector blocks in the design versions B, C, D and F with screw connections.

### Card holders for adapting rack cards in Euro format to plug-in connectors according to IEC603 / DIN 41612 and DIN 41617

Card holders enable the fast conversion of electronic components.

As with interface units, IEC 803/ DIN 41612/617 plug-in connectors on card holders are converted to screw /push-on connection technology.

The card holders are constructed as follows:

- card with PCB terminals and standardised plug-in connector for mounting an electronic module in 19" Euro format: 160x100 or 233x160 mm
- retension pillars and interlock for securing the card
- mounting plate and mounting foot for mounting directly or onto mounting rails.

The SKH2 card holder range is distinguished by its design and functionality

- 19" Euro card completely protected at the rear against foreign bodies.
- eject mechanism guarantees one-hand operation
- electronic module can be secured to the front, similar to the 19" rack

Card holders are used in industrial applications where individual 19" modules need to be quickly adapted, but the costs for 19" card racks are too high. Card racks are voluminous, and are generally only accessible from the rear. As a rule, they do not have screw / tension clamp connections for external wiring, which makes them difficult to handle for wiring purposes.

Card holders are considered in the first place

- if only a few cards are to be installed and connected
- if the conductor card is placed decentralized, i.e., favourable for wiring
- if older installations are to be extended with additional electronic modules

Other typical applications are test equipment and testing modules in production processes and laboratories.

This is where a fast exchange of the card and an optimum handling of the connection level are of a premium.

### Standards

The following standards are fulfilled:

EN 50178 Fitting heavy voltage installations with electronic equipment

DIN VDE 0109 Coordination of insulation in low voltage installations including clearance and creepage distances for assembled cards.

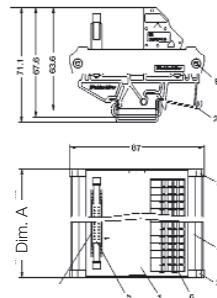

## Interface Units

### For ribbon cable connections according to IEC 603-1/DIN 41 651

- With fixing foot for TS 32, TS 35 x 7.5 and TS 35 x 15
- Male connector block with interlock for female connector block with strain relief according to DIN 41 651/ Parts1 and 2
- RSF on FS 45 profile is equipped with an additional potential connection for test purposes
- Optionally available with tension clamp or Screw connection

## Interface Units

### Distributors for 8, 16 and 72 positive and negative potentials

- Adapts 2 supply connections to 8/16 or 72 potential distribution terminals
- Potential distributor designed as two- or three-tier connection element
- RS VERT8 and RS VERT16 offer clearly arranged potential distribution in tight spaces.  
They are designed for residual currents of 10 A.
- RS LPK3/144 VERT is designed for residual currents of 20A.

## Interface Units

**Plug-in connectors designs  
in accordance with IEC 603/DIN 41612**

### Production series 1

Plug-in connectors from this production series are of conventional, high-pole design with low contact distances and a max. current carrying capacity of 1 A. In addition, there are versions commercially available on the market with up to 4 A contact currents in 5.08-mm grid with less poles (up to 48).

#### Design B

A 64-pole plug-in connector with row assignment a and b, and a contact current capacity of max. 1A. The rated voltage is defined in accordance with IEC 664/ EN 50178 as 125 V. A variant is a 32-pole version, where only the odd number poles are assembled.

#### Design C

An extension of design B; the addition of contact row c results in a 96-pole plug-in connector. An alternative design is type C 64, with which the outer rows c and a are assembled. A further reduction of the assembly results in the design C 32, with a vertical and horizontal contact grid dimension of 5.08 mm.

#### Design D

The dimensions and contact arrangement are identical with the C 32 design. The strengthened contacts can be loaded with up to 4 A.

#### Design E

An extension of the design D 32; the addition of the contact row e results in the 48-pole version of design E. With 4 A contact current in 5.08-mm grid dimension, this plug-in connector has been designed for heavy current loads. All even numbered poles are assembled in the contact rows e, c and a.

### Production series 2

This design differs from that of the design 1 with its differing grid dimensions of the rear connections of 5.08 mm and the contact rows of 3.81 mm on the mating face. The plastic housing has been designed to be higher at the back in order to increase the creepage distances (metal plate, PCB etc.). This results in an altered wiring level when compared with production series 1. The contacts have fundamentally been designed for a current carrying capacity of 4 A. These plug-in connectors are largely used for applications in power electronics. The fixing holes are arranged on the outside of the blocks in the middle.

#### Design F

48-pole, fully assembled contact rows d, b and z. Variants with part assembly of the rows z and b or z and d in 32-pole design are commercially available. The distinguishing feature of the designs with the contact variation z/d is their larger insulating distances.

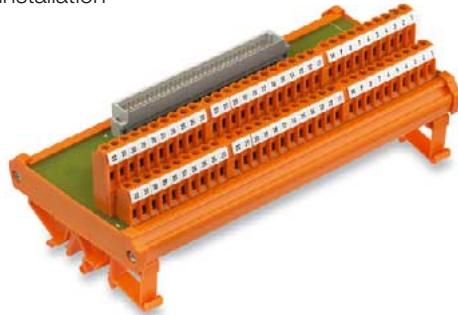

#### Design H

These have the same dimensions as design F, and are assembled 11- or 15-pole high-current contacts. The plugging geometry differs from the other designs. The contacts have a current carrying capacity of max. 15 A.

## Card Holders

For inserting 19" rack cards  
in Euro format

- Convert IEC 603/DIN 41 612 and 41 617 plug-in connectors to LP connection elements
- Mechanical lever reliably releases and ejects card
- 19" inserts secured from the front
- Protective cover on rear side of card
- Mount direct in switchgear cabinet or on TS 35 mounting rail
